

# Package ‘ClickClust’

July 21, 2025

**Version** 1.1.6

**Date** 2023-12-02

**Title** Model-Based Clustering of Categorical Sequences

**Depends** R ( $\geq 3.0.0$ )

**LazyLoad** yes

**LazyData** no

**Description** Clustering categorical sequences by means of finite mixtures with Markov model components is the main utility of ClickClust. The package also allows detecting blocks of equivalent states by forward and backward state selection procedures.

**License** GPL ( $\geq 2$ )

**Author** Volodymyr Melnykov [aut, cre],  
Rouben Rostamian [ctb, cph] (memory allocation in c)

**Maintainer** Volodymyr Melnykov <vmelnykov@ua.edu>

**NeedsCompilation** yes

**Repository** CRAN

**Date/Publication** 2023-12-03 05:50:02 UTC

ClickClust-package      *Model-based clustering of categorical sequences*

---

## Description

The package runs finite mixture modeling and model-based clustering for categorical sequences

## Details

Function 'click.EM' runs the EM algorithm for finite mixture models with Markov model components.

## Author(s)

Volodymyr Melnykov

Maintainer: Volodymyr Melnykov <vmelnykov@cba.ua.edu>

## References

## Examples

```
set.seed(123)

n.seq <- 50

p <- 5
K <- 2
mix.prop <- c(0.3, 0.7)

TP1 <- matrix(c(0.20, 0.10, 0.15, 0.15, 0.40,
               0.20, 0.20, 0.20, 0.20, 0.20,
               0.15, 0.10, 0.20, 0.20, 0.35,
               0.15, 0.10, 0.20, 0.20, 0.35,
               0.30, 0.30, 0.10, 0.10, 0.20), byrow = TRUE, ncol = p)

TP2 <- matrix(c(0.15, 0.15, 0.20, 0.20, 0.30,
               0.20, 0.10, 0.30, 0.30, 0.10,
               0.25, 0.20, 0.15, 0.15, 0.25,
               0.25, 0.20, 0.15, 0.15, 0.25,
               0.10, 0.30, 0.20, 0.20, 0.20), byrow = TRUE, ncol = p)
```

```
TP <- array(rep(NA, p * p * K), c(p, p, K))
TP[, ,1] <- TP1
TP[, ,2] <- TP2

# DATA SIMULATION

A <- click.sim(n = n.seq, int = c(10, 50), alpha = mix.prop, gamma = TP)
C <- click.read(A$$)

# EM ALGORITHM

click.EM(X = C$X, K = 2)
```

---

B3

*Dataset: result of backward state selection*

---

## Description

These data demonstrate the result of the backward state selection procedure obtained for the dataset "C".

## Usage

```
data(utilityB3)
```

## Details

Results of the backward state selection procedure assuming three components are provided for the dataset "C".

## References

**Examples**

```
data(utilityB3)

dev.new(width = 11, height = 11)
click.plot(X = C$X, id = B3$id, colors = c("lightyellow", "red", "darkred"), col.levels = 10)
```

---

C

*Dataset: simulated dataset*

---

**Description**

This dataset is used to run the backward state selection procedure (results in "B3").

**Usage**

```
data(utilityB3)
```

**Details**

Original dataset used to illustrate the utility of backward selection.

```

---

click.backward	<i>Backward search for equivalent states</i>
----------------	--

---

**Description**

Runs backward search to detect blocks of equivalent states.

**Usage**

```
click.backward(X, K, eps = 1e-10, r = 100, iter = 5, bic = TRUE,
              min.gamma = 1e-3, scale.const = 1.0, silent = FALSE)
```

**Arguments**

X	dataset array (p x p x n)
K	number of mixture components
eps	tolerance level
r	number of restarts for initialization
iter	number of iterations for each short EM run
bic	flag indicating whether BIC or AIC is used
min.gamma	lower bound for transition probabilities
scale.const	scaling constant for avoiding numerical issues
silent	output control

**Details**

Runs backward search to detect blocks of equivalent states. States  $i$  and  $j$  are called equivalent if their behavior expressed in terms of transition probabilities is identical, i.e., the probabilities of leaving  $i$  and  $j$  to visit another state  $h$  are the same as well as the probabilities of coming to  $i$  and  $j$  from another state  $h$  are the same; this condition should hold for all mixture components. Notation:  $p$  - number of states,  $n$  - sample size,  $K$  - number of mixture components,  $d$  - number of equivalence blocks.

**Value**

z	matrix of posterior probabilities (n x K)
alpha	vector of mixing proportions (length K)
gamma	array of transition probabilities (d x d x K)
states	detected equivalence blocks (length p)
logl	log likelihood value
BIC	Bayesian Information Criterion
AIC	Akaike Information Criterion
id	classification vector (length n)

B <- click.read(A$$S)

# BACKWARD SEARCH

click.backward(X = B$X, K = 2)
```

click.EM

*EM algorithm for mixtures of Markov models***Description**

Runs the EM algorithm for finite mixture models with Markov model components.

**Usage**

```
click.EM(X, y = NULL, K, eps = 1e-10, r = 100, iter = 5, min.beta = 1e-3,
min.gamma = 1e-3, scale.const = 1)
```

**Arguments**

X	dataset array (p x p x n)
y	vector of initial states (length n)
K	number of mixture components
eps	tolerance level
r	number of restarts for initialization
iter	number of iterations for each short EM run
min.beta	lower bound for initial state probabilities
min.gamma	lower bound for transition probabilities
scale.const	scaling constant for avoiding numerical issues

**Details**

Runs the EM algorithm for finite mixture models with first order Markov model components. The function returns estimated mixing proportions 'alpha' and transition probability matrices 'gamma'. If initial states 'y' are not provided, initial state probabilities 'beta' are not estimated and assumed to be equal to  $1/p$ . In this case, the total number of estimated parameters is given by  $M = K - 1 + K * p * (p - 1)$ . Otherwise, initial state probabilities 'beta' are also estimated and the total number of parameters is  $M = K - 1 + K * (p - 1) + K * p * (p - 1)$ . Notation: p - number of states, n - sample size, K - number of mixture components, d - number of equivalence blocks.

**Value**

z	matrix of posterior probabilities (n x K)
id	classification vector (length n)
alpha	vector of mixing proportions (length K)
beta	matrix of initial state probabilities (K x p)
gamma	array of transition probabilities (p x p x K)
logl	log likelihood value
BIC	Bayesian Information Criterion

---

click.forward	<i>Forward search for equivalent states</i>
---------------	---

---

### Description

Runs forward search to detect blocks of equivalent states.

### Usage

```
click.forward(X, K, eps = 1e-10, r = 100, iter = 5, bic = TRUE,
  min.gamma = 1e-3, scale.const = 1.0, silent = FALSE)
```

### Arguments

X	dataset array (p x p x n)
K	number of mixture components
eps	tolerance level
r	number of restarts for initialization
iter	number of iterations for each short EM run
bic	flag indicating whether BIC or AIC is used
min.gamma	lower bound for transition probabilities
scale.const	scaling constant for avoiding numerical issues
silent	output control

### Details

Runs forward search to detect blocks of equivalent states. States  $i$  and  $j$  are called equivalent if their behavior expressed in terms of transition probabilities is identical, i.e., the probabilities of leaving  $i$  and  $j$  to visit another state  $h$  are the same as well as the probabilities of coming to  $i$  and  $j$  from another state  $h$  are the same; this condition should hold for all mixture components. Notation:  $p$  - number of states,  $n$  - sample size,  $K$  - number of mixture components,  $d$  - number of equivalence blocks.

**Value**

<code>z</code>	matrix of posterior probabilities (n x K)
<code>alpha</code>	vector of mixing proportions (length K)
<code>gamma</code>	array of transition probabilities (d x d x K)
<code>states</code>	detected equivalence blocks (length p)
<code>logl</code>	log likelihood value
<code>BIC</code>	Bayesian Information Criterion
<code>AIC</code>	Akaike Information Criterion
<code>id</code>	classification vector (length n)

               0.10, 0.30, 0.20, 0.20, 0.20), byrow = TRUE, ncol = p)
```

```

TP <- array(rep(NA, p * p * K), c(p, p, K))
TP[, ,1] <- TP1
TP[, ,2] <- TP2

# DATA SIMULATION

A <- click.sim(n = n.seq, int = c(10, 50), alpha = mix.prop, gamma = TP)
C <- click.read(A$$)

# FORWARD SEARCH

click.forward(X = C$X, K = 2)

```

---

click.plot

*Plot of the obtained clustering solution*

---

### Description

Constructs a click-plot for the clustering solution.

### Usage

```

click.plot(X, y = NULL, file = NULL, id, states = NULL, marg = 1,
  font.cex = 2, font.col = "black", cell.cex = 1, cell.lwd = 1.3,
  cell.col = "black", sep.lwd = 1.3, sep.col = "black",
  obs.lwd = NULL, colors = c("lightcyan", "pink", "darkred"),
  col.levels = 8, legend = TRUE, leg.cex = 1.3, top.srt = 0,
  frame = TRUE)

```

### Arguments

X	dataset array (p x p x n)
y	vector of initial states (length n)
file	name of the output pdf-file
id	classification vector (length n)
states	vector of state labels (length p)
marg	plot margin value (for the left and top)
font.cex	magnification of labels
font.col	color of labels
cell.cex	magnification of cells
cell.lwd	width of cell frames

<code>cell.col</code>	color of cell frames
<code>sep.lwd</code>	width of separator lines
<code>sep.col</code>	color of separator lines
<code>obs.lwd</code>	width of observation lines
<code>colors</code>	edge colors for interpolation
<code>col.levels</code>	number of colors obtained by interpolation
<code>legend</code>	legend of color hues
<code>leg.cex</code>	magnification of legend labels
<code>top.srt</code>	rotation of state names in the top
<code>frame</code>	frame around the plot

### Details

Constructs a click-plot for the provided clustering solution. Click-plot is a graphical display representing relative transition frequencies for the partitioning specified via the parameter 'id'. If the parameter 'file' is specified, the constructed plot will be saved in the pdf-file with the name 'file'. If the width of observation lines 'obs.lwd' is not specified, median colors will be used for all cell segments.

# CONSTRUCT CLICK-PLOT

click.plot(X = C$X, y = C$y, file = NULL, id = M2$id)

```

---

click.predict                      *Prediction of future state visits*

---

### Description

Calculates the transition probability matrix associated with the M-step transition.

### Usage

```
click.predict(M = 1, gamma, pr = NULL)
```

### Arguments

M	number of transition steps (M = 1 by default)
gamma	array of transition probabilities (p x p x K)
pr	vector of probabilities associated with components (length K)

**Details**

Returns a transition probability matrix associated with the M-step transition. If the vector `pr` is not specified, all components are assumed equally likely.

```

---

click.read

*Reading sequences of visited states*

---

### Description

Prepares sequences of visited states for running the EM algorithm.

### Usage

```
click.read(S)
```

### Arguments

S                    list of numeric sequences

### Details

Prepares sequences of visited states for running the EM algorithm by means of the click.EM() function.

### Value

X                    dataset array (p x p x n) (p - # of states, n - # of sequences)  
y                    vector of initial states (length n)

```

---

`click.sim`*Simulating sequences of visited states*

---

**Description**

Simulates sequences of visited states.

**Usage**

```
click.sim(n, int = c(5, 100), alpha, beta = NULL, gamma)
```

**Arguments**

<code>n</code>	number of sequences
<code>int</code>	interval defining the lower and upper bounds for the length of sequences
<code>alpha</code>	vector of mixing proportions (length $K$ )
<code>beta</code>	matrix of initial state probabilities ( $K \times p$ )
<code>gamma</code>	array of $K \times p \times p$ transition probability matrices ( $p \times p \times K$ )

**Details**

Simulates `n` sequences of visited states according to the following mixture model parameters: `'alpha'` - mixing proportions, `'beta'` - initial state probabilities, `'gamma'` - transition probability matrices. If the matrix `'beta'` is not provided, all initial states are assumed to be equal to  $1 / p$ .

**Value**

<code>S</code>	list of simulated sequences
<code>id</code>	true classification of simulated sequences

click.var

*Variance-covariance matrix estimation*

---

**Description**

Estimates the variance-covariance matrix for model parameter estimates.

**Usage**

```
click.var(X, y = NULL, alpha, beta = NULL, gamma, z)
```

**Arguments**

X	dataset array (p x p x n)
y	vector of initial states (length n)
alpha	vector of mixing proportions (length K)
beta	matrix of initial state probabilities (K x p)
gamma	array of transition probabilities (p x p x K)
z	matrix of posterior probabilities (n x K)

**Details**

Returns an estimated variance-covariance matrix for model parameter estimates.

msnbc323

*Dataset: msnbc323*

---

### Description

A portion of the msnbc dataset containing 323 clickstream sequences. This version of the original dataset (David Heckerman) was used in Melnykov (2014).

There are 17 states representing the following categories:

- 1: frontpage
- 2: news
- 3: tech
- 4: local
- 5: opinion
- 6: on-air
- 7: misc
- 8: weather

- 9: msn-news
- 10: health
- 11: living
- 12: business
- 13: msn-sports
- 14: sports
- 15: summary
- 16: bbs
- 17: travel

### **Usage**

```
data(msnbc323)
```

### **Format**

List of 323 numeric vectors representing categorical sequences.

### **Source**

Melnykov, V. (2014)

### **References**

synth

---

print.object

*Functions for Printing or Summarizing Objects*

---

### **Description**

EM and search classes for printing and summarizing objects.

**Usage**

```
## S3 method for class 'EM'  
print(x, ...)  
## S3 method for class 'EM'  
summary(object, ...)  
## S3 method for class 'search'  
print(x, ...)  
## S3 method for class 'search'  
summary(object, ...)
```

**Arguments**

x	an object with the 'EM' (or 'search') class attributes.
object	an object with the 'EM' (or 'search') class attributes.
...	other possible options.

**Details**

Some useful functions for printing and summarizing results.

synth

*Illustrative dataset: sequences of five states*

---

**Description**

The data represents the synthetic dataset used as an illustrative example in the Journal of Statistical Software paper discussing the use of the package.

There are 5 states denoted as A, B, C, D, and E. Categorical sequences have lengths varying from 10 to 50.

**Usage**

```
data(synth)
```

**Format**

\$data contains a vector of 250 strings representing categorical sequences; \$id is the original classification vector.

**Source**

Melnykov, V. (2015)
